(A) are used (i) for recombinant expression of polypeptides (B) and (ii) to isolate complete genes. (B) are used (i) to identify agents suitable for treatment of uterine or endometrial cancer; (ii) directly for treating these forms of cancer (including expression from gene therapy vectors) and (iii) for generation of specific antibodies. (A) are identified by assembling BSTs (expressed expression patterns. This allows a significantly longer fragment of the gene to be revealed, so should reduce the number of failures associated with the fact that ESTs from different libraries may represent different parts of the same unknown gene, distorting the estimated frequency of occurrence in a particular tissue. ANY59941-Y60328 represent protein fragments encoded by the human endometrium tumour cDNA library derived
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nucleic acid sequences expressed in uterine cancer tissues, and derived polypeptides, for treatment of uterine and endometrial cancer and identification of therapeutic agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Dahl E;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes novel human nucleic acid (cDNA) sequences (A)

that are applied to plant crops to protect them from insect damage. The polymocleotides may be used in the production of transgenic plants that express the insecticidal polypeptides and consequently have improved insect resistance compared to non-transformed plants. Monocotyledonous or dicotyledonous plants may be protected in this way, for example corn, wheat, soybean, oat, cotton, rice, rye, sorghum, sugarcane, tomato, tobacco, kapok, flax, potato, barley, turf grass, pasture grass, berry, fruit, legume, vegetable, ornamental plant, shrub, cactus and/or treefort. A wide range of insects (e.g. gypsy moth, looper, tobacco budworm, cotton leaf perforator and spruce budworm) may be affected by application of the insecticidal polypeptides (full details given in specification)
                                                                                                                                                                                                                                                  transgenic plant; corn; wheat; soybean; oat; cotton; rice; rye; sorghum; sugarcane; tomaco; tobacco; kapok; flax; potato; barley; turf grass; pasture grass; berry; fruit; legume; vegetable; ornamental plant; shrub; cactus; tree cell; gypsy moth; looper; tobacco budworm; spruce budworm; cotton leaf perforator; CryET44.

The sequence represents a B. thuringiensis Lepidopteran-active deltaendotoxin, crystal protein CryET45. The Lepidopteran-active B. thuringiensis delta-endotoxin polypeptides may be used as compositions that are applied to plant crops to protect them from insect damage. The polymuclectides may be used in the production of transgenic plants that express the insecticidal polypeptides and consequently have improved insect resistance compared to non-transformed plants. Monocotyledonous or dicotyledonous plants may be protected in this way, for example corn, wheat, soybean, oat, cotton, rice, rye, sorghum, sugarcane, tomato, tobacco, kapok, flax, potato, barley, tuff grass, pasture grass, berry, totacco, kapok, flax, potato, barley, tuff grass, pasture grass, berry, totacco, kapok, flax, potato, barley, tuff grass, pasture grass, berry, totacco, kapok, day, presented plant, shrub, cactus and/or tree cell. A wide range of insects (e.g gypsy moth, looper, tobacco budworm, cotton leaf perforator and spruce budworm) may be affected by application of the insecticidal polypeptides (full details given in specification)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
                                                                                                                                                                                                                                                                        Lepidopteran-active Bacillus thuringiensis delta-endotoxin polypeptides and the polynucleotides that encode them, useful for increasing the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         à
                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a polypeptide (I) containing an the memoglobulin (Ig) heavy chain dimer having no Ig light chain in which the amino acid sequence of a ligand-combined partner is a receptor, a carrier protein, a hormone, a growth factor, an ersceptor, a carrier protein, a hormone, a growth factor, an expensive or a nutritive or substance, but is not a subunit polypeptide encoded by a lymphocyte inducing receptor, an Ig gene super family-constituting element, a protein homologous to it, or a separated gene substitute of the variable region of at least one Ig heavy chain. Its combined partner is fused with the amino acid sequence of an Ig stationary region at its C-end and maintains its combining feature. Also described: (I) a nucleic acid cacid of (I); (2) a replicable expression vector containing the nucleic acid of (I); (3) a composition containing cells transformed by the expression vector of (2); and (4) producing (I), comprising culturing the cypression vector of (2); and (4) producing (I), comprising culturing the cyplypeptide is recovered from the cells are cultured and the polypeptide is recovered from molecule and a ligand. In an example from the containing the resent invention mouse lymphocyte cell surface glycoprotein designated LHR (MLHR) was isolated from a mouse spleen and alload. The present sequence represents an amino acid sequence given in comparison with an MLHR amino acid sequence, which is used in an example from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Delta endotoxin, Lepidopteran-active, crystal protein, insecticide, transgenic plant; corn, wheat; soybean; oat; cotton; rice; rye; sorghum; sugarcane; tomato; tobaco; kapok; flax; potato; barley; turf grass; pasture grass; berry; fruit; legume; vegetable; ornamental plant; shrub; cactus; tree cell; gypsy moth, looper; tobacco budworm; spruce budworm; cotton leaf perforator; CryET45.
                                                                                                                                                                                                                                                                        A fused protein consisting of a ligand-combined protein and a stable plasma protein, a polypeptide, a nucleic acid, a replicable expression vector, a composition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

```
acid sequence, particularly to identify Lactococcus lactis or related species. The proteins of the invention are useful for the biosynthesis or blodegradation of a composition of interest. The invention helps research in lactic bacteria, particularly useful in the production of yogurt and cheese. Note: The sequence data for this patent is based on equivalent operent WO200177334 (published 18-OCT-2001) which is available in electronic format directly from WIPO at the production of 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequence represents a B. thuringiensis Lepidopteran-active delta-endocoxin, crystal protein CryET56. The Lepidopteran-active B. thuringiensis delta-endocoxin polypeptides may be used as compositions that are applied to plant crops to protect them from insect damage. The polynucleotides may be used in the production of transgenic plants that express the insecticidal polypeptides and consequently have improved insect resistance compared to non-transformed plants. Monocotyledonous or dicocyledonous plants may be protected in this way, for example corn, wheat, soybean, oat, cotton, rice, rye, sorghum, sugarcane, tomato, tobacco, xapok, flax, poatto, barley, turf grass, pasture grass, berry, fruit, legume, vegetable, ornamental plant, shrub, cactus and/or tree cell. A wide range of insects (e.g. gypsy moth, looper, tobacco budworm,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Delta endotoxin; Lepidopteran-active; crystal protein; insecticide; transgenic plant; corn; wheat; soybean; oat; cotton; rice; rye; sorghum; sugarcane; tomarc; tobacco; kapok; flax; potato; barley; turf grass; pasture grass; berry; fruit; legume; vegetable; ornamental plant; shrub; cactus; tree cell; gypsy moth, looper; tobacco budworm; spruce budworm; cotton leaf perforator; CryET56.

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid moding a polypeptide whose expression is inhibited by the antisense concleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding cantisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway confideration, (7) identifying a compound that inhibits cellular proliferation, (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profilling a compound; a activity; (11) a culture comprising strains in which the gene compound a activity; (11) a culture comprising strains in which the gene compound is activity; (11) a culture comprising strains in which the gene
                                                                                                                                        ·

to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this pattent din not form part of the printed specification, but was obtained fire.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Leinamycin biosynthesis gene cluster; Lmn; open reading frame; ORF; anti-tumour antibiotic; broad spectrum antimicrobial activity; Gram-positive; Gram-negative bacteria; chemical modification; metabolite;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to the isolation of the Streptomyces atroolivaceus leinamycin (Lnm) blosynthesis gene cluster containing 71 open reading frames (ORFs ) (ORFs -35 through -1, ORFs lnm& through lnm², and ORFs +1 through +9). Leinamycin is a novel anti-tumour antibiotic produced by several Streptomyces species. It exhibits broad spectrum antimicrobial activity against Gram-positive and Gram-negative bacteria, but not against fungi. The polypeptides encoded by the Lnm biosynthesis gene cluster ORFs are useful for chemically medifying a molecule in a host cell. The host cell is a bacterium or eukaryotic cell, including a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    apo-carrier protein; holo-carrier protein; tumour; polyketide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               -NUL-8
            cc mammalian, yeast, plant, fungal, or insect cell. The molecule is an endogenous metabolite produced by the host cell or exogenously supplied metabolite, or an anino acid, and the polypeptide is a peptide synthetase cor amino transferase. The polypeptides encoded by the Imm gene cluster are useful for converting an apo-carrier protein to a holo-carrier protein. Inm shows potent antitumour activity in tumour models in vivo. The Inm gene cluster modules and/or catalytic domains are useful for making various peptide and/or polyketide, and/or hybrid polypeptide/polyketide metabolites. The proteins encoded by the ORFs are useful alone, or in combination with other active domains to modify various target substrates. The Imm gene cluster is useful to upregulate endogenous Imm production to permit Imm production in cells and/or to make various modified Imm. Inm, its analoque, or other polyketide, competide or hybrid polyketide/peptide metabolites are useful as the peptide or hybrid polyketide/peptide metabolites are useful as the proteins encoded by or offer of metabolites. ABUI1311-ABUI1411 represent the proteins encoded by or offer offer of the S. atroolivaceus leinamycin blosynthesis gene cluster
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to isolated canine low affinity immunoglobulin E (IgE) receptor (CD23) polypeptides and encoding nucleic acid molecules. The CD23 polypeptides can be expressed by standard recombinant methodology. The CD23 polynucleotides are useful for protecting canids from diseases mediated by CD23, for developing compounds that regulate IgE and/or CD23 lavels in a canid for treating allergy related diseases such as atopic dermatitis, asthma, hay fever and food sensitivities. The present sequence represents a CD23 receptor PsCaCD23_123
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated canine low affinity immunoglobulin B receptor nucleic ac
molecule, useful for protecting canids from diseases mediated by the
receptor, such as allergy, atopic dermatitis, asthma, and hay fever.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 7-JUN-
  ·.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is a polypeptide encoded by one of a large number of 5. ESTs derived from mRNAs encoding secreted proteins. The 5. ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3. untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5. ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the fill 5. UTR is rarely included. 5. ESTs are derived from mRNAs with intact 5. ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5. ESTs mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors
                                                                                                                                                                                                            Human; 5' EST; expressed sequence tag; secreted protein; cDNA isolation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to isolated nucleic acid molecules and their can concoded secreted proteins. The nucleic acids and proteins are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a also used in diagnosing a pathological condition. Antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic immunossays e.g. radioimmunossays or enzyme linked immunosorbant assays (BLISA). Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. carchiac arrest, carebrovascular disorders e.g. carchiac arrest, carebrovascular disorders e.g. cerebral ischaemia, anglogenesis, nervous system disorders e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection, and many other disorders listed in the specification. The polypeptides can also be used to aid wound healing and epithalial cell proliferation, to pervent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .

        polynucleotides. The polypeptides and polynucleotides are useful in gene therapy for treating, inhibiting or preventing neural disorders, immune system disorders (e.g. system) clubus erythematosus, rheumatoid arthritis and multiple sclerosis), muscular disorders, respiratory diseases (e.g. and multiple sclerosis), muscular disorders, gastrointestinal disorders, pulmonary disorders, cardiovascular disorders (e.g. congenital heart defects, Ebstein's anomaly and hypoplastic left heart syndrome), renal disorders (e.g. acute kidney failure and end-stage renal disease), hyperproliferative disorders (e.g. Hodgkin's disease and appendicitis), allergic reactions and conditions (e.g. asthma), blood appendicitis), allergic reactions and conditions (e.g. asthma) blood infarction) and cancerous diseases. Sequences ABUS4914-ABUS5699 and ABUS5748 represent human novel polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                       Protein identification; signal transduction pathway; metabolic pathway, hybridisation assay; genetic mapping; gene expression control; promoter;

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chomosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed considerably techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a cuplypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding pattners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders cupvolpheptide and polymucleotide sequences have applications in the pulymers of data and products dependent on DNA and cand to produce other types of data and products dependent on DNA and amino acid sequences. Abgonolo-Abg30377 represent novel human diagnostic maino acid sequences Abgonolo-Abg30377 represent novel human diagnostic patent did not appear in the printed specification, but was obtained in celectronic format directly from WIND at
New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.
                                                                                                                                                                                                                                                                        Claim 20; SEQ ID NO 33829; 103pp; English.

Dybocosystem I chain III - Odontella sinensis chloroplast
NiAlternate names: photosystem I plastocyanin-binding chain
C;Species: chloroplast Odontella sinensis
C;Date: 17-Feb-1998 #sequence_revision 26-Feb-1998 #text_change 20-Jun-2000
C;Accession: S78329
R;Kowallik, K.V.; Stoebe, B.; Schaffran, I.; Kroth-Pancic, P.; Freier, U.
Plant Mol. Biol. Rep. 13, 336-342, 1995
A;Itle: The Chloroplast Genome of a chlorophyll a+c- containing Alga, Odontella sinens
A;Reference number: S7828
A;Accession: S78329
A;Accession: S78329
A;Status: preliminary; nucleic acid sequence not shown; translation not shown
A;Molecule type: DNA
A;Residues: 1-185 <KOW>
A;Cross-references: EMBL:Z67753; NID:g1185127; PIDN:CAA91702.1; PID:g1185219
